LiveID +

eSignAnyWhere third-party API integration

Issued by: Namirial Spa

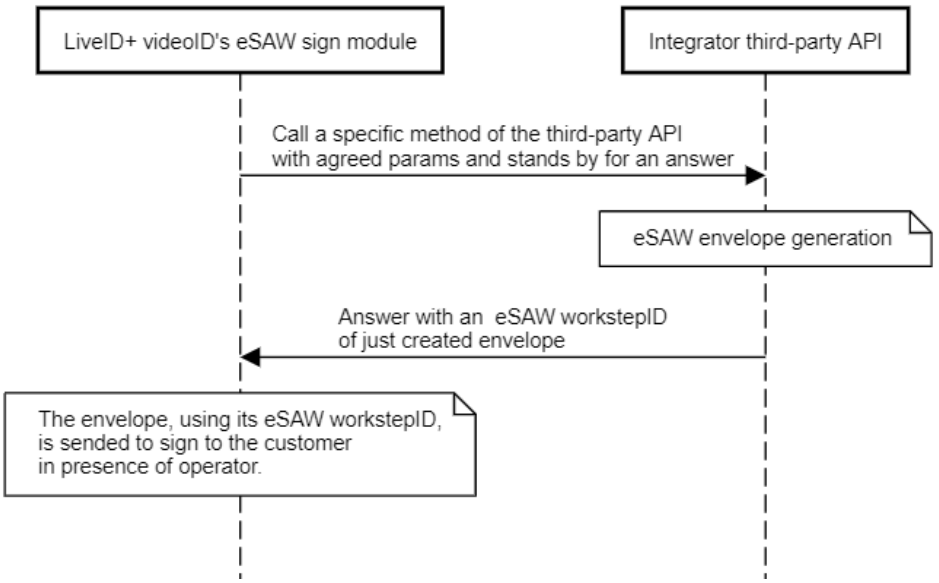

eSignAnyWhere third-party API integration

LiveID+ allows the signing of a document during a videoID using an eSAW workstepID served from onBoarding page or entered by operator straight inside the videoID, but in addition to this it can also handle a call to a third-party API for generating an eSaw envelope “live” with data collected in the videoID previous modules.

In order to do that the integrator must provide the call details during the organization configuration phase in LiveID+. This API is linked to one or more specific processes of the organization.

LiveID+ can send to the integrator's third-party service all the needed data provided during the videoID and wait for an answer (thus is requested a synchronous eSaw envelope generation) that contains an eSaw workstepID. That workstepID is sent to sign, in the specific LiveID+ module, to the customer in presence of the operator.

The third-party API call must comply with the REST model. LiveID+ can call that third-party API method only with a POST request. The data served from LiveID+ to the third-party API method can be agreed during the organization configuration phase inside LiveID+.

Call example:

URL of third-party API method >
https://integrator.site/method/

Example params:

Name	*Value*
name	John
surname	Doe
email	j.doe@testMail.com

Request URL: https://integrator.site/method/
Request Method: POST
▼ Form Data
name: John
email: j.doe@testMail.com
surname: Doe

Expected response example (JSON formatted):

{"service":"/method","success":true,"workstepId":"40F66D4FCB9493582FE88C51E353074AD823FB221BA84477CF9C4831CAA2AEE655FBACD3F1FC4B5DE3A417AC0C5427DE"}
